John Swift

Software Engineer

Software engineer in Kansas City. Sole engineer on the live point of sale that took in-store and cash payments, and on call when it went down. Went on to develop auction and inventory software for weekly auctions.

EXPERIENCE

Revlogical/Segistics, Kansas City, MO - *Software Engineer*

September 2021 - November 2026

Mobile auction - September 2022 to November 2026

The mobile app handled bidding for the North Kansas City and Liberty warehouse auction. Each auction had 1,000-2,000 items, and about 1,000 people on it at once. Rebuilt app (with team) targeting reliability during peak traffic. The first sale on the rebuilt app was about $200,000. The app then had online capabilities added for white labeled clients.

- For in person, bidders would scan QR codes and have the lot added to a list after making a bid.
- For remote bidding, lots would have titles, descriptions, and pictures.
- Auctions were created and lots added via an admin web application.
- Web bidding was added later.

Inventory application - January 2025 to November 2026

An inventory system was added to the admin web application. Shipments, manifests, and items were taken into the system, evaluated, and then sent to auction.

- Built the inventory application in React, on Google Cloud and Cloud Firestore
- Unified database architecture for auctions so admin UI only had one database to interact with, and items were only stored once
- QA'd other engineers' tickets fresh: wrote each test plan from app experience in parallel with unit and automated tests

Point of sale development and maintenance - September 2021 to January 2026

In-store and auction registers for seven Midwest locations, on the order of $100,000 a week at a location. Facebook Marketplace sales were paid through this same software. **Sole engineer. Python, React, AWS -Kubernetes.**

- Shipped small fixes on same day, with larger fixes getting tested before deployment.
- Took the call from store staff when the point of sale was down.
- **Investigated outages** that were from systems we were using, such as Platinum Processing.
- Prioritized **fast and reliable transactions;** eg, researching and implementing solution for shortening in-store shopping times by moving the newest line to the top of the list so cashiers saw the rewards price when the scan came back, instead of scrolling for it.

- Responsible for **transaction tracing and troubleshooting**; e.g. Traced a cash-drawer gap to specific transactions so leadership had evidence, Showed leadership the software was right when cashiers ran every card as debit to skip the credit fee.
- Managed sunset and transition of live systems.
- Configured operations with vendors managing customer card data, which never touched our servers..

Pre-software engineering work experience

- Worked in insurance and local government before switching careers.

SKILLS

Languages - Python, JavaScript

Frameworks - React, React Native

Cloud - AWS, Google Cloud, Cloud Firestore

AI tools - Claude, GitHub Copilot (including Pull Request reviews)

EDUCATION

Centriq Training, Kansas City, MO - *Full stack developer boot camp*

October 2020 - February 2021

A full stack development boot camp that taught HTML, CSS, JavaScript, MVC, C#, and SQL.

HOBBIES

- Tabletop RPGs- Run frequent sessions of DND 5e and mothership, and play in other systems including pathfinder, savage worlds, and draw steel.
- Film - Avid theater goer and physical media collector.
- Exploring the city - Let's talk about your favorite local coffee shops, bars, and restaurants
