SKILLS

Custom point of sale software (React, javaScript, Python, AWS) that took in store card and cash payments. Auction and inventory software (React, React Native, Google Cloud, Cloud Firestore). Sole engineer on the live point of sale, and on call when it went down. Claude assisted development and used Copilot reviews on pull requests.

EXPERIENCE

Revlogical/Segistics, Kansas City, MO - *Software Engineer*

September 2021 - November 2026

Mobile auction - September 2022 to November 2026

The mobile app handled bidding for the North Kansas City and Liberty warehouse auction. Each auction had 1,000-2,000 items, and about 1,000 people on it at once. Rebuilt app (with team) targeting reliability during peak traffic. The first sale on the rebuilt app was about $200,000. The app then had online capabilities added for white labeled clients.

- For in person, bidders would scan qr codes and have the lot added to a list after making a bid.
- For remote bidding, lots would have titles, descriptions, and pictures.
- Auctions were created and lots added via an admin web application.
- Web bidding was added later.

Inventory - January 2025 to November 2026

An inventory system was added to the admin web application. Shipments, manifests, and items were taken into the system, evaluated, and then sent to auction.

- Inventory had to be added to the cloud firestore database for auctions so admin UI only had one database to interact with.
- As part of quality assurance, regularly tested other engineers' tickets by reading the ticket, with no scripted plan.

Point of sale development and maintenance - September 2021 to January 2026

In-store and auction registers, with seven Midwest locations, on the order of $100,000 a week at a location, plus revenue from Facebook Marketplace.

- Became the sole engineer after the front-end engineer left and the backend engineer left about four months later. Python, React, AWS.
- Shipped small fixes the same day. Took the call from store staff when the point of sale was down.
- Investigated outages that were from systems we were using, such as platinum processing.
- Prioritized fast and reliable transactions in development; eg, researching and implementing solution for shortening in-store shopping times by moving the newest line to the top of the list so cashiers saw the rewards price when the scan came back, instead of scrolling for it.
- Responsible for transaction tracing and troubleshooting; e.g. Traced a cash-drawer gap to specific transactions so leadership had evidence, Showed leadership the software was right when cashiers ran every card as debit to skip the credit fee.
- Learned Python on this system. First production ticket was email and password, as the backend engineer was leaving. No course before that.
- Managed sunset and transition of live systems

Pre-Sofware Engineering Work Experience

- Worked in insurance and local government before switching careers.

EDUCATION

Centriq Training, Kansas City, MO - *Full stack developer boot camp*

October 2020 - February 2021

A full stack development boot camp that taught HTML, CSS, javascript, MVC, C#, and SQL.

HOBBIES

- Tabletop RPGs- Has run DND 5e and mothership, and played in other systems including pathfinder, savage worlds, a draw steel.
- Film - Avid theater goer and physical media collector.
- Exploring the city - Enjoys trying new coffee shops, bars, and restaurants
